

## 73fifty Firmware Update Instructions:

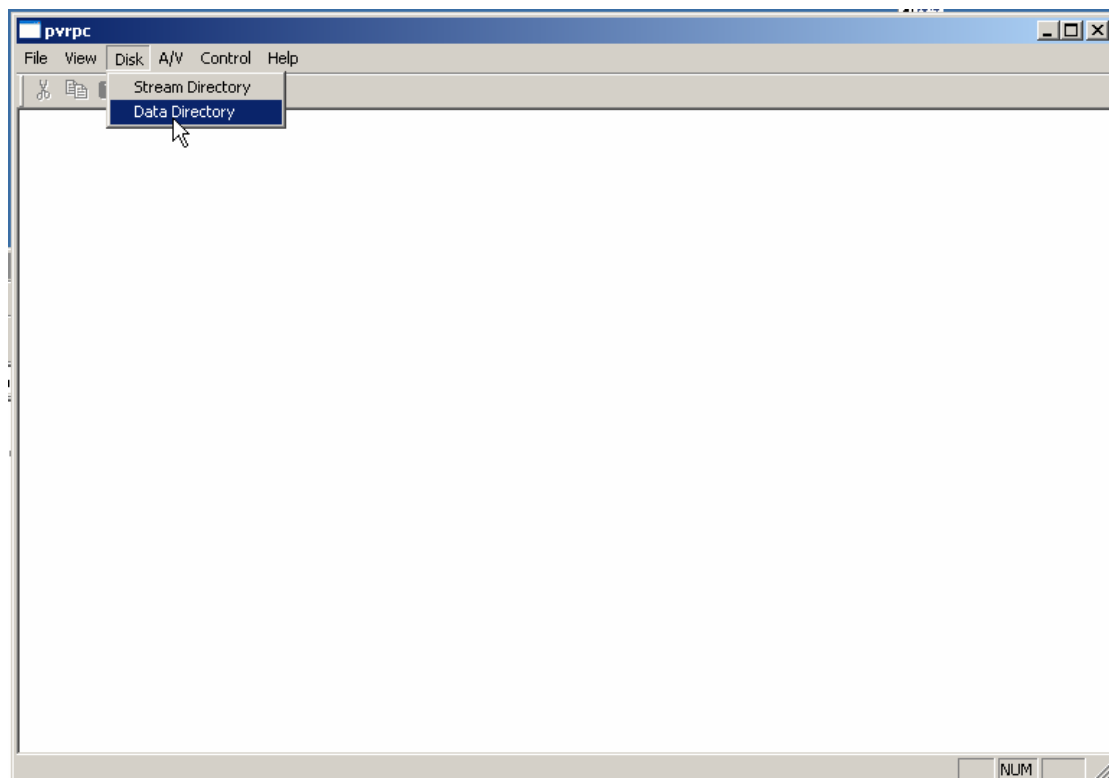

Unzip the update to a temporary location on the PC which will be connected to the 73fifty via USB (e.g. c:\temp).

Select RUN from the windows START menu, and enter the install path\pvrpc -w

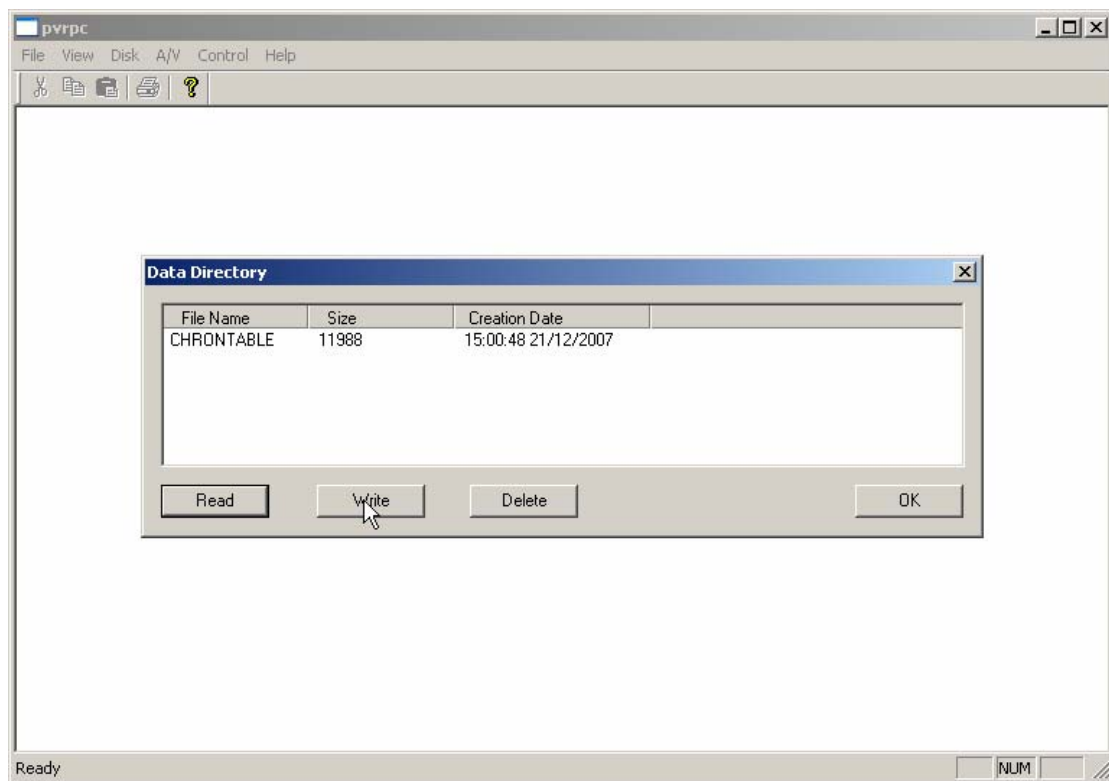

(do not attempt to just double click on the pvrpc app – as this will not include the '-w' instruction, which is required to enable to writing of data to the 73fifty.

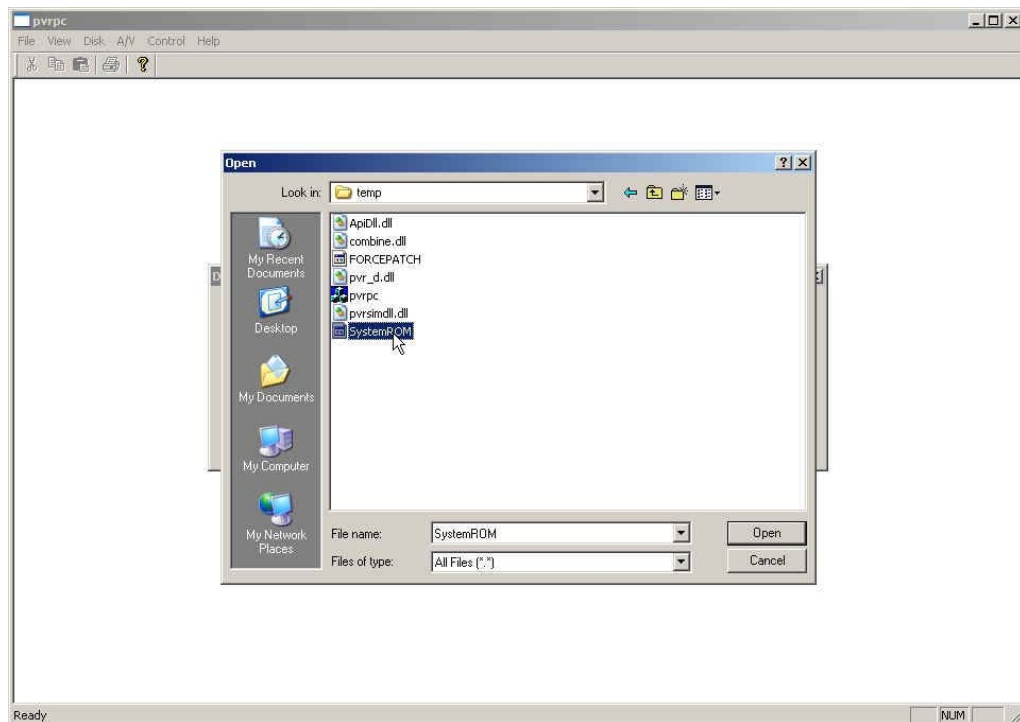

When the program starts, from the 'DISK' pull down, select 'DATA'

A view of the data partition will then open, with 4 buttons – click on 'Write'

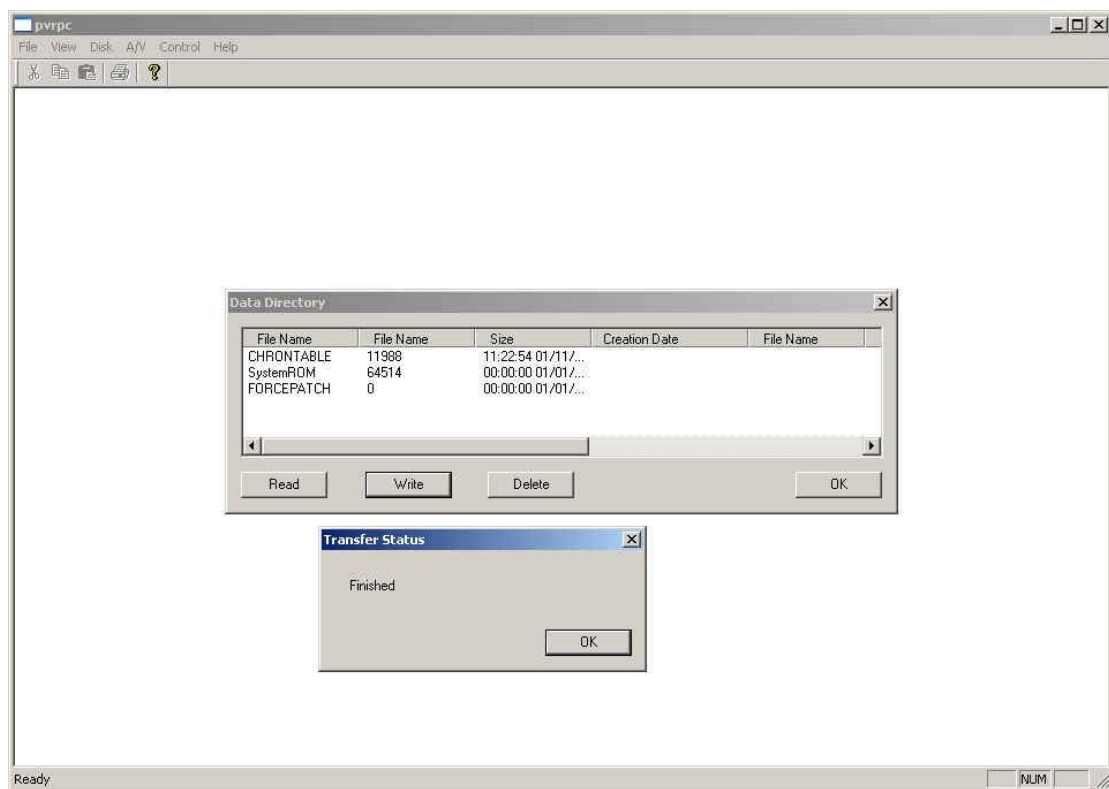

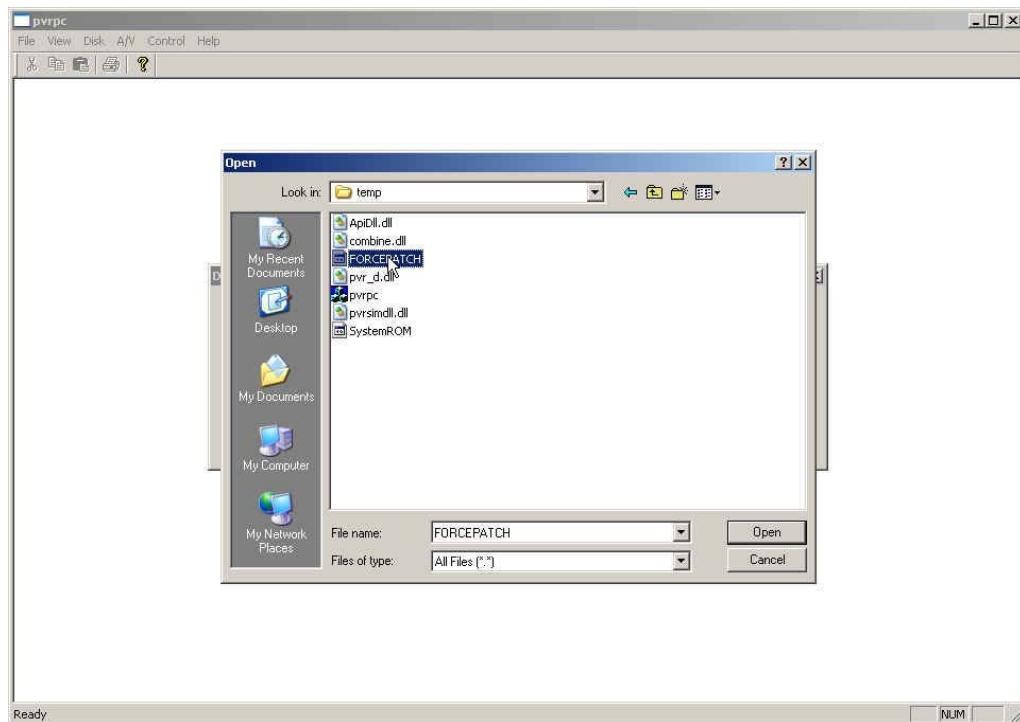

A file browser window will open – navigate to the temporary location where the files were initially placed (e.g c:\temp) and select SystemROM

Upon clicking 'OPEN' – it will transfer to the 73fifty.

Repeat the above process and upload the file called FORCEPATCH:

To complete the process – power cycle the 73fifty.

When it powers up, it will do the Starting ..... procedure as normal – but then it will change to saying '72fifty Kernel found, Verifying .....

The process may take a few minutes – once complete, the unit will start as normal.
